Who on the team benefits from the information provided?

(Given the benefits of a stage, who do you think is concerned with when/where/how the stage is configured and the outputs of the stage running?)

Could it be speeded up with parallelization?

(Two or more stages could be run at the same time to make the pipeline faster to run, do you see anywhere that could help your pipeline?)

How will each step be started?

(Stages can be triggered to start automatically or Manually or based on the state of another step. Which steps might you start in each way?)

Will anyone be blocked when a stage is broken?

(Review each stage to see if anyone or any activity would be blocked by a failure at that stage. Indicate who or what activity may be blocked.)

Who is responsible for fixing a problem with a broken stage?

How long between check-in and feedback from each stage?

(While each stage now has time frames to run them on, have a look at how long it may take on average before the stage is started. Does anything wait in a queue for a manual action? How long is this on average?)
